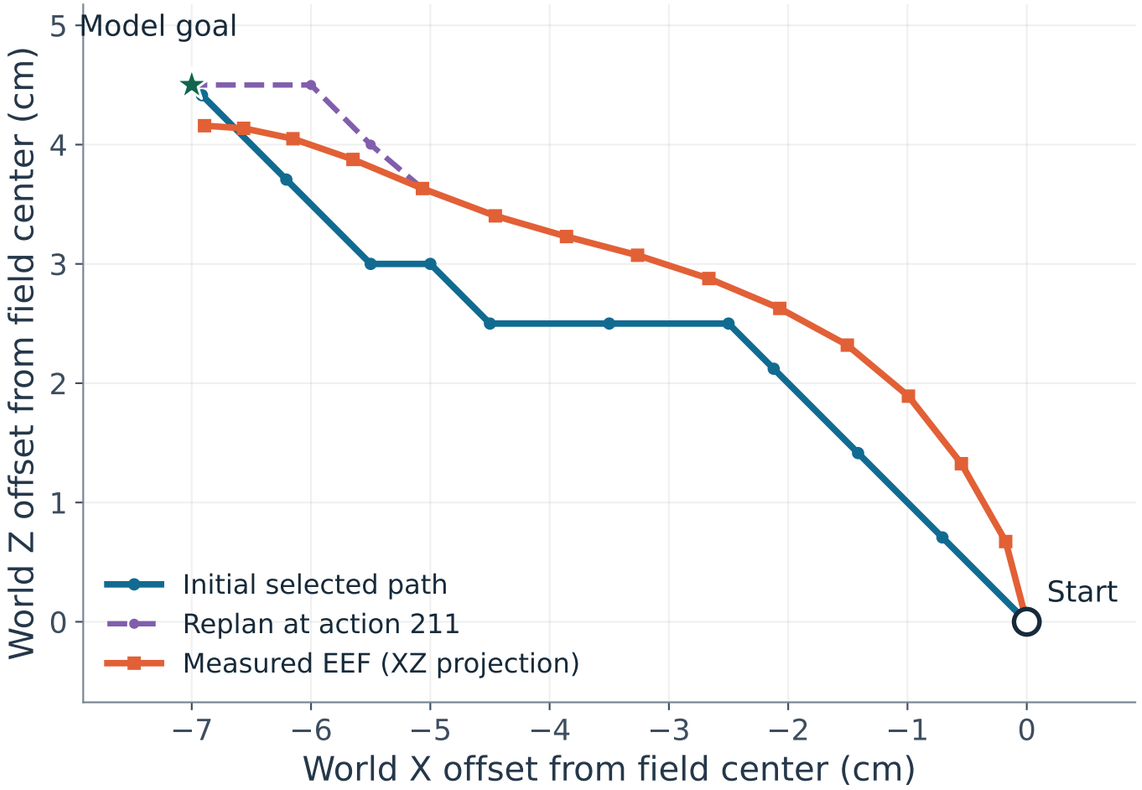
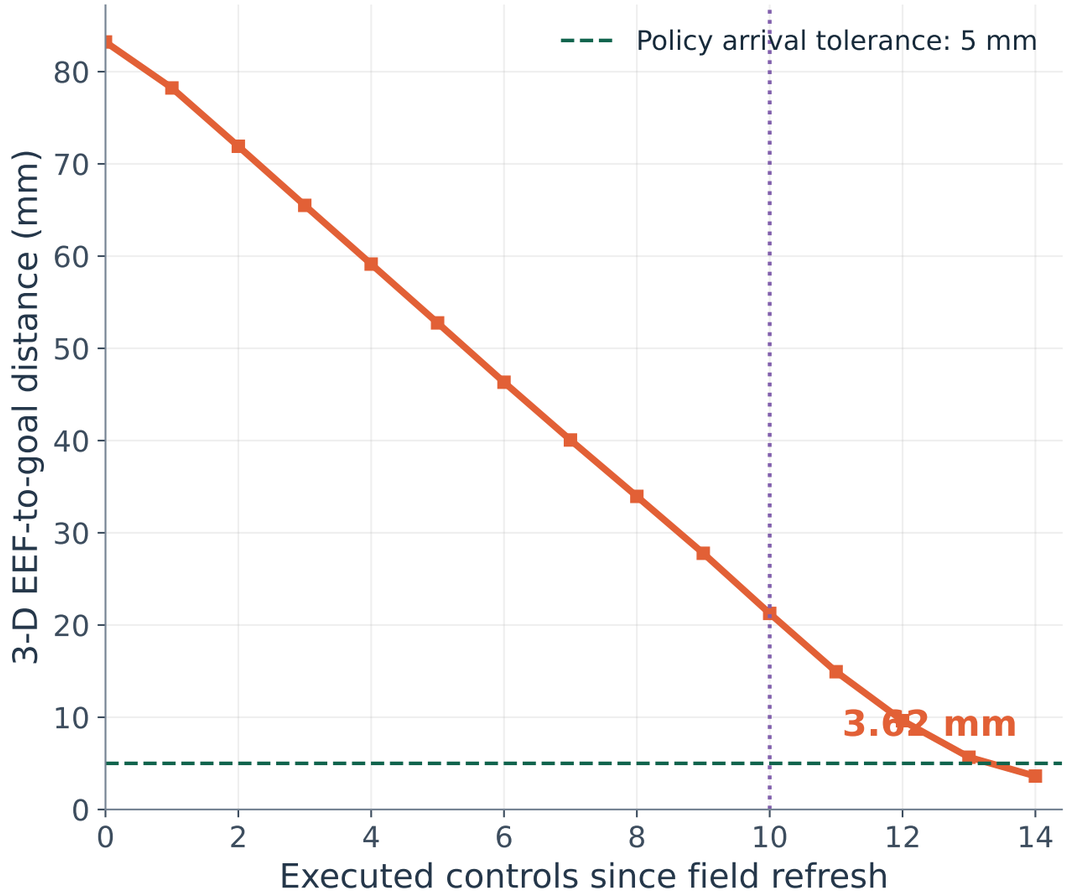
A geometric path is followed from successive measured poses

Recorded actions 201–214 (zero-based) | 14 executed controls | EEF measurements only

Planned geometry and actual motion



Distance to the model's goal



Initial selected path: 8.743 cm | Measured travel: 8.578 cm | Final error: 3.62 mm

The controller replanned after 10 actions, then requested a new model field after measured arrival.

Paths at different times are not synchronized point pairs; the left panel is an XZ projection of 3-D data.
